# RULE-BASED CLASSIFIERS

Pasquale Rullo

rullo@mat.unical.it

# **Classification Rules**

- A rule-based classifier is a set of propositional rules of the form
  - IF outlook=sunny and Humidity=normal THEN PlayTennis=yes
  - IF Humidity=normal and wind=strong THEN PlayTennis=yes

# **Classification Rules**

Alternative notation

- outlook=sunny and Humidity=normal  $\rightarrow$  yes
- Humidity=normal and wind=strong  $\rightarrow$  yes
- Equivalent to DNF
  - (Outlook=sunny and Humidity=normal) OR (Humidity=normal and wind=strong)

# **Classification Rules**

#### Rules can be generated

- straight from training data (direct)
- indirectly from a decision tree (indirect)
- RIPPER is the most well known direct rule learner

- Greedy approach which reduces the problem of learning a set of rules to a sequence of simpler problems, each requiring that a single rule is learned
- Once a rule r is learned, all covered examples (both positive and negative) are removed from the training set, so that the next generated rule is different from r
- It learns rules until it can no longer learn a rule whose performance is above the given *Threshold*

(i) Original Data

(ii) Step 1

(iii) Step 2

(iv) Step 3

- Seq-Cov(Attributes, Examples, Threshold)
  - for each class c in {c<sub>1</sub>, ..., c<sub>k</sub>}
    - Classifier<sub>c</sub> = {};
    - PosExam<sub>c</sub> is the set of Examples with label = c;
    - NegExam<sub>c</sub> is the set of Examples with label <> c
    - $Exam_c = PosExam_c \cup NegExam_c$ ;
    - Rule = Learn-One-Rule(Attributes, Examples)
    - while performance(Rule,Examples) > Threshold do
      - Classifier<sub>c</sub> = Classifier<sub>c</sub>  $\cup$  { Rule}
      - Exam<sub>c</sub> = Exam<sub>c</sub> {examples covered by Rule}
      - Rule = Learn-One-Rule(*Attributes*, *Examples*)
    - endWhile
  - endFor
  - Sort classifiers according to their performance on Examples
  - Add default rule {} -> default class (with minimum priority)
- return

- Seq-Cov(Attributes, Examples, Threshold)
  - for each class c in {c<sub>1</sub>, ..., c<sub>k</sub>}
    - Classifier<sub>c</sub> = {}
    - PosExam<sub>c</sub> is the set of Examples with label = c;
    - NegExam<sub>c</sub> is the set of Examples with label <> c
    - $Exam_c = PosExam_c \cup NegExam_c$ ;
    - Rule = Learn-One-Rule(Attributes, Examples)
    - while performance(Rule,Examples) > Threshold do
      - Classifier<sub>c</sub> = Classifier<sub>c</sub>  $\cup$  { Rule}
      - Exam<sub>c</sub>= Exam<sub>c</sub>- {examples covered by Rule}
      - Rule = Learn-One-Rule(Attributes, Examples)
    - endWhile
  - endFor
  - Sort classifiers according to their performance on Examples
  - Add default rule {} -> default class (with minimum priority)
- return

# Learn-One-Rule

- **Objective**: learning a rule that covers many positive examples and few negative ones (possibly none)
- Method: Grows the rules in a greedy fashion based on a general-to-specific approach
  - It starts with the most general rule, i.e., one with the empty antecedent (it covers all the examples of the training set – poor performance)
  - Then greedily adds the attribute that most improves rule performance (e.g., accuracy) over the training set
  - The process is repeated by adding a second attribute, and so on and so forth
  - The process is repeated until the rule reaches an acceptable level of performance

# Selecting an attribute

 Select the attribute that most increases rule performance (accuracy, or other measures, e.g., Laplace rank, FOIL's Information Gain) of the current rule

Example

- $r_0: a \rightarrow c$
- $r_1$ : a,  $b \rightarrow c$
- Select attribute b if
  - performance(r<sub>1</sub>) > performance (r<sub>0</sub>) and
  - performance  $(r_1) > performance (r_j)$
- for each rule  $r_j$  obtainable by adding in the antecedent of  $r_0$  any attribute other than b

| Name          | Give Birth | Lay Eggs | Can Fly | Live in Water | Have Legs | Class      |

| Grizzly bear | yes            | no      | no               | warm          | ?     |
| turtle       | no             | no      | sometimes        | cold          | ?     |

- $c_{bird}$ : (Gives Birth = no)  $\land$  (Can Fly = yes)  $\rightarrow$  Bird
- $c_{fish}$ : (Gives Birth = no)  $\land$  (Lives in Water = yes)  $\rightarrow$  Fish
- $c_{mammal}$ : (Gives Birth = yes)  $\land$  (Blood Type = warm)  $\rightarrow$  Mammal
- $c_{amphibian}$ : (Lives in Water = sometimes)  $\rightarrow$  Amphibian
- $c_{reptile}$ : (Gives Birth = no)  $\land$  (Can Fly = no)  $\rightarrow$  Reptile

| Name         | Gives<br>birth | Can fly | Live in<br>water | Blood<br>type | class  |
|--------------|----------------|---------|------------------|---------------|--------|
| hawk         | no             | yes     | no               | warm          | bird   |
| Grizzly bear | yes            | no      | no               | warm          | mammal |
| turtle       | no             | no      | sometimes        | cold          | ?      |

- $c_{bird}$ : (Gives Birth = no)  $\land$  (Can Fly = yes)  $\rightarrow$  Bird
- $c_{fish}$ : (Gives Birth = no)  $\land$  (Lives in Water = yes)  $\rightarrow$  Fish
- $c_{mammal}$ : (Gives Birth = yes)  $\land$  (Blood Type = warm)  $\rightarrow$  Mammal

Ambiguity!!

- $c_{amphibian}$ : (Lives in Water = sometimes)  $\rightarrow$  Amphibian
- $c_{reptile}$ : (Gives Birth = no)  $\land$  (Can Fly = no)  $\rightarrow$  Reptile

Name Can fly Gives Lives in Blood class birth water type hawk bird yes warm no no Grizzly bear mammal yes no no warm ????? turtle sometimes cold no no

#### Rules are not mutually exclusive Ordered Rule Sets

- To solve the ambiguity, we order classifiers according to their reliability
- The less mistakes over the training data a classifier makes, the more reliable it is

#### Rules are not mutually exclusive Ordered Rule Sets

- Assume c<sub>bird</sub>>c<sub>fish</sub>>c<sub>mammal</sub>>c<sub>amphibian</sub>>c<sub>reptile</sub>
- Classifiers are ordered in decreasing order of reliability
- When a new instance is presented, it is classified by the highest-ranked classifier triggered by the instance

## Rules are not mutually exclusive Ordered Rule Sets

- Classifiers are ordered
  - $c_{bird}$ : (Gives Birth = no)  $\land$  (Can Fly = yes)  $\rightarrow$  Bird
  - $c_{fish}$ : (Gives Birth = no)  $\land$  (Lives in Water = yes)  $\rightarrow$  Fish
  - $c_{mammal}$ : (Gives Birth = yes)  $\land$  (Blood Type = warm)  $\rightarrow$  Mammal
  - $c_{amphibian}$ : (Lives in Water = sometimes)  $\rightarrow$  Amphibian
  - $c_{reptile}$ : (Gives Birth = no)  $\land$  (Can Fly = no)  $\rightarrow$  Reptile

| Name         | Gives<br>birth | Can fly | Live in<br>water | Blood<br>type | class  |
|--------------|----------------|---------|------------------|---------------|--------|
| hawk         | no             | yes     | no               | warm          | bird   |
| Grizzly bear | yes            | no      | no               | warm          | mammal |
| turtle       | no             | no      | sometimes        | cold          | Amphib |

Turtle is NOT a reptile according to the above model, as  $c_{\text{amphibian}}$  is more reliable than  $c_{\text{reptile}}$ 

- Seq-Cov(Attributes, Examples, Threshold)
  - for each class c in  $\{c_1, ..., c_k\}$ 
    - Classifier<sub>c</sub> = {}
    - PosExam is the set of examples with label = c;
    - NegExam is the set of examples with label <> c
    - $Exam_c = PosExam \cup NegExam;$
    - Rule = Learn-One-Rule(Attributes, Examples)
    - while performance(Rule,Examples) > Threshold do
      - Classifier<sub>c</sub> = Classifier<sub>c</sub>  $\cup$  { Rule}
      - Exam<sub>c</sub> = Exam<sub>c</sub> {examples covered by Rule}
      - Rule = Learn-One-Rule(Attributes, Examples)
    - endWhile
  - endFor
  - Sort classifiers according to their performance on Examples
  - Add default rule {} -> default class (with minimum priority)
- return

# Rules are not exhaustive Default rule

- Rules are not exhaustive: an instance may not trigger any rule
  - $c_{bird}$ : (Gives Birth = no)  $\land$  (Can Fly = yes)  $\rightarrow$  Bird
  - $c_{fish}$ : (Gives Birth = no)  $\land$  (Lives in Water = yes)  $\rightarrow$  Fish
  - $c_{mammal}$ : (Gives Birth = yes)  $\land$  (Blood Type = warm)  $\rightarrow$  Mammal
  - $c_{amphibian}$ : (Lives in Water = sometimes)  $\rightarrow$  Amphibian
  - $c_{reptile}$ : (Gives Birth = no)  $\land$  (Can Fly = no)  $\rightarrow$  Reptile

| Name          | Gives<br>birth | Can fly | Lives in<br>water | Blood<br>type | class |
|---------------|----------------|---------|-------------------|---------------|-------|
| dogfish shark | yes            | no      | yes               | cold          | ?     |

• Dogfish shark does not trigger any rule

#### Rules are not exhaustive Default rule

- The instance is assigned to a default class, i.e., the class assigned by the default rule
  - → default class
- this is triggered when all other rules have failed
- Default class: majority class of training examples not covered by any rule

#### Rules are not exhaustive Default rule

- $c_{bird}$ : (Gives Birth = no)  $\land$  (Can Fly = yes)  $\rightarrow$  Bird
- $c_{fish}$ : (Gives Birth = no)  $\land$  (Lives in Water = yes)  $\rightarrow$  Fish
- $c_{mammal}$ : (Gives Birth = yes)  $\land$  (Blood Type = warm)  $\rightarrow$  Mammal
- $c_{amphibian}$ : (Lives in Water = sometimes)  $\rightarrow$  Amphibian
- $c_{reptile}$ : (Gives Birth = no)  $\land$  (Can Fly = no)  $\rightarrow$  Reptile
- Default rule: {} → Mammal

| Name          | Gives<br>birth | Can fly | Lives in<br>water | Blood<br>type | class  |
|---------------|----------------|---------|-------------------|---------------|--------|
| dogfish shark | yes            | no      | yes               | cold          | mammal |

#### Sequential covering – rule-based ordering

- Seq-Cov(Attributes, Examples, Threshold)
- for each class c in {c<sub>1</sub>, ..., c<sub>k</sub>}
  - Classifier = {}
  - PosExam<sub>c</sub> is the set of examples with label = c;
  - NegExam<sub>c</sub> is the set of examples with label <> c
  - Exam<sub>c</sub>= PosExam<sub>c</sub>∪ NegExam<sub>c</sub>;
  - Rule = Learn-One-Rule(Attributes, Examples)
  - while performance(Rule,Examples) > Threshold do
    - Classifier = Classifier + Rule
    - Exam<sub>c</sub>= Exam<sub>c</sub>- {examples covered by Rule}
    - Rule = Learn-One-Rule(Attributes, Examples)
  - endWhile
  - endFor
  - sort Classifier according to their performance on Examples
  - Add default rule {} -> default class (with minimum priority)
- return

# How a rule-based classifier works Summary

- When a new instance is presented to the classifier
  - It is assigned to the class label of the highest ranked rule it has triggered
  - If none of the rules is fired, it is assigned to the default class

#### C4.5 rules versus RIPPER

#### C4.5 rules versus RIPPER

C4.5:

```
(Give Birth=Yes) \rightarrow Mammals
```

(Give Birth=No, Lives In Water = no, Can Fly=Yes) → Birds

(Give Birth=No, Live in Water=Yes)  $\rightarrow$  Fishes

(Give Birth=No, Live in Water=No, Can Fly=No) → Reptiles

(Give Birth=No, Live in Water=sometimes) → Amphibian

RIPPER:

(Live in Water=Yes)  $\rightarrow$  Fishes

(Have Legs=No) → Reptiles

(Give Birth=No, Can Fly=No, Live In Water=No) → Reptiles

(Can Fly=Yes,Give Birth=No) → Birds

 $() \rightarrow Mammals$ 

#### C4.5 rules versus RIPPER

#### C4.5rules:

|        |            |            | PREDICTE |          |       |         |
|--------|------------|------------|----------|----------|-------|---------|
|        |            | Amphibians | Fishes   | Reptiles | Birds | Mammals |
| ACTUAL | Amphibians | 2          | 0        | 0        | 0     | 0       |
| CLASS  | Fishes     | 0          | 2        | 0        | 0     | 1       |
|        | Reptiles   | 1          | 0        | 3        | 0     | 0       |
|        | Birds      | 1          | 0        | 0        | 3     | 0       |
|        | Mammals    | 0          | 0        | 1        | 0     | 6       |

#### **RIPPER**:

|        |            | PREDICTED CLASS |        |          |       |         |
|--------|------------|-----------------|--------|----------|-------|---------|
|        |            | Amphibians      | Fishes | Reptiles | Birds | Mammals |
| ACTUAL | Amphibians | 0               | 0      | 0        | 0     | 2       |
| CLASS  | Fishes     | 0               | 3      | 0        | 0     | 0       |
|        | Reptiles   | 0               | 0      | 3        | 0     | 1       |
|        | Birds      | 0               | 0      | 1        | 2     | 1       |
|        | Mammals    | 0               | 2      | 1        | 0     | 4       |

#### Advantages of Rule-Based Classifiers

- As highly expressive as decision trees
- Easy to interpret
- Can classify new instances rapidly
- Performance comparable to decision trees
