

## Capitolo 5 - Pointers and Strings

### Outline

- 5.1 Introduction
- 5.2 Pointer Variable Declarations and Initialization
- 5.3 Pointer Operators
- 5.4 Calling Functions by Reference
- 5.5 Using the Const Qualifier with Pointers
- 5.6 Bubble Sort Using Call-by-reference
- 5.7 Pointer Expressions and Pointer Arithmetic
- 5.8 The Relationship Between Pointers and Arrays
- 5.9 Arrays of Pointers
- 5.10 Case Study: A Card Shuffling and Dealing Simulation
- 5.11 Function Pointers
- 5.12 Introduction to Character and String Processing
  - 5.12.1 Fundamentals of Characters and Strings
  - 5.12.2 String Manipulation Functions of the String-handling Library
- 5.13 Thinking About Objects: Interactions Among Objects

## 5.1 Introduction

- Pointers
  - Powerful, but difficult to master
  - Simulate call-by-reference
  - Close relationship with arrays and strings

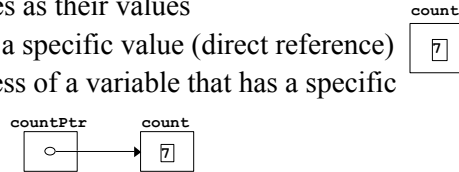

## 5.2 Pointer Variable Declarations and Initialization

- Pointer variables
  - Contain memory addresses as their values
  - Normal variables contain a specific value (direct reference)
  - Pointers contain the address of a variable that has a specific value (indirect reference)
- Indirection
  - Referencing a pointer value
- Pointer declarations
  - `*` indicates variable is a pointer
 

```
int *myPtr;
```

 declares a pointer to an `int`, a pointer of type `int *`
  - Multiple pointers require multiple asterisks
 

```
int *myPtr1, *myPtr2;
```

## 5.2 Pointer Variable Declarations and Initialization

- Can declare pointers to any data type
- Pointers initialization
  - Initialized to `0`, `NULL`, or an address
    - `0` or `NULL` points to nothing

## 5.3 Pointer Operators

- **&** (address operator)

- Returns the address of its operand

- Example

```
int y = 5;
int *yPtr;
yPtr = &y;    // yPtr gets address of y
```

- **yPtr** “points to” **y**

© 2000 Deitel & Associates, Inc. All rights reserved.

## 5.3 Pointer Operators

- **\*** (indirection/dereferencing operator)

- Returns the value of what its operand points to

- **\*yPtr** returns **y** (because **yPtr** points to **y**).

- **\*** can be used to assign a value to a location in memory

```
*yPtr = 7;    // changes y to 7
```

- Dereferenced pointer (operand of **\***) must be an lvalue (no constants)

- **\*** and **&** are inverses

- Cancel each other out

```
*&myVar == myVar
```

and

```
&*yPtr == yPtr
```

8

## 5.4 Calling Functions by Reference

- Call by reference with pointer arguments
  - Pass address of argument using & operator
  - Allows you to change actual location in memory
  - Arrays are not passed with & because the array name is already a pointer
  - \* operator used as alias/nickname for variable inside of function
 

```

void doubleNum( int *number )
{
    *number = 2 * ( *number );
}

```
  - \***number** used as nickname for the variable passed in
  - When the function is called, must be passed an address
 

```

doubleNum( &myNum );

```

## 5.5 Using the Const Qualifier with Pointers

- **const** qualifier
  - Variable cannot be changed
  - **const** used when function does not need to change a variable
  - Attempting to change a **const** variable is a compiler error
- **const** pointers
  - Point to same memory location
  - Must be initialized when declared
    - int \*const myPtr = &x;**
      - Constant pointer to a non-constant **int**
    - const int \*myPtr = &x;**
      - Non-constant pointer to a constant **int**
    - const int \*const Ptr = &x;**
      - Constant pointer to a constant **int**

1 // Fig. 5.13: fig05_13.cpp	△	Outline
2 // Attempting to modify a constant pointer to	▽	
3 // non-constant data		
4 #include <iostream>		1. Declare variables
5		
6 int main()		1.1 Declare const pointer to an int.
7 {		
8 int x, y;	Changing *ptr is allowed - x is not a constant.	
9		2. Change *ptr (which is x).
10 int * const ptr = &x; // ptr is a constant pointer to an		
11 // integer. An integer can be modified		2.1 Attempt to change ptr.
12 // through ptr, but ptr always points		
13 // to the same memory location.		
14 *ptr = 7;		
15 ptr = &y;	Changing ptr is an error - ptr is a constant pointer.	3. Output
16		
17 return 0;		
18 }		
Error E2024 Fig05_13.cpp 15: Cannot modify a const object in function main()		Program Output

12

## 5.6 Bubble Sort Using Call-by-reference

- Implement bubblesort using pointers
  - swap** function must receive the address (using **&**) of the array elements
    - array elements have call-by-value default
  - Using pointers and the **\*** operator, **swap** is able to switch the values of the actual array elements
- Psuedocode
  - Initialize array*
  - print data in original order*
  - Call function bubblesort*
  - print sorted array*
  - Define bubblesort*

© 2000 Deitel & Associates, Inc. All rights reserved.

## 5.6 Bubble Sort Using Call-by-reference

- **sizeof**

- Returns size of operand in bytes
- For arrays, sizeof returns  
( the size of 1 element ) \* ( number of elements )
- if **sizeof( int ) = 4**, then  
    **int myArray[10];**  
    **cout << sizeof(myArray);**  
will print 40

- **sizeof** can be used with

- Variable names
- Type names
- Constant values

© 2000 Deitel & Associates, Inc. All rights reserved.  

```

1 // Fig. 5.15: fig05_15.cpp
2 // This program puts values into an array, sorts the values into
3 // ascending order, and prints the resulting array.
4 #include <iostream>
5
6 using std::cout;
7 using std::endl;
8
9 #include <iomanip>
10
11 using std::setw;
12
13 void bubbleSort( int *, const int );
14
15 int main()
16 {
17     const int arraySize = 10;
18     int a[ arraySize ] = { 2, 6, 4, 8, 10, 12, 89, 68, 45, 37 };
19     int i;
20
21     cout << "Data items in original order\n";
22
23     for ( i = 0; i < arraySize; i++ )
24         cout << setw( 4 ) << a[ i ];
25
26     bubbleSort( a, arraySize );           // sort the array
27     cout << "\nData items in ascending order\n";
28
29     for ( i = 0; i < arraySize; i++ )
30         cout << setw( 4 ) << a[ i ];
31
32     cout << endl;
33     return 0;
34 }

```

Bubblesort gets passed the address of array elements (pointers). The name of an array is a pointer.

### Outline

1. Initialize array
  - 1.1 Declare variables
2. Print array
  - 2.1 Call bubbleSort
  - 2.2 Print array

<pre> 36 void bubbleSort( int *array, const int size ) 37 { 38     void swap( int * const, int * const ); 39 40     for ( int pass = 0; pass &lt; size - 1; pass++ ) 41 42         for ( int j = 0; j &lt; size - 1; j++ ) 43 44             if ( array[ j ] &gt; array[ j + 1 ] ) 45                 swap( &amp;array[ j ], &amp;array[ j + 1 ] ); 46 } 47 48 void swap( int * const element1Ptr, int * const element2Ptr ) 49 { 50     int hold = *element1Ptr; 51     *element1Ptr = *element2Ptr; 52     *element2Ptr = hold; 53 } </pre>	<div style="text-align: center;">   </div> <p style="text-align: center; margin-top: 10px;"><u>Outline</u></p> <p><b>3. Define bubbleSort</b></p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p><b>swap</b> takes pointers (addresses of array elements) and dereferences them to modify the original array elements.</p> </div>

## 5.7 Pointer Expressions and Pointer Arithmetic

- Pointer arithmetic
  - Increment/decrement pointer ( ++ or -- )
  - Add/subtract an integer to/from a pointer( + or += , - or -= )
  - Pointers may be subtracted from each other
  - Pointer arithmetic is meaningless unless performed on an array
- 5 element **int** array on a machine using 4 byte **ints**
  - **vPtr** points to first element **v[ 0 ]**, which is at location 3000
    - **vPtr = 3000**
  - **vPtr += 2**; sets **vPtr** to 3008
    - **vPtr** points to **v[ 2 ]**

location

3000	3004	3008	3012	3016
v[0]	v[1]	v[2]	v[3]	v[4]

pointer variable **vPtr**

© 2000 Deitel & Associates, Inc. All rights reserved.

## 5.7 Pointer Expressions and Pointer Arithmetic

- Subtracting pointers
  - Returns the number of elements between two addresses

```
vPtr2 = v[ 2 ];
vPtr = v[ 0 ];
vPtr2 - vPtr == 2
```

- Pointer comparison
  - Test which pointer points to the higher numbered array element
  - Test if a pointer points to 0 (**NULL**)

```
if ( vPtr == '0' )
    statement
```

## 5.7 Pointer Expressions and Pointer Arithmetic

- Pointers assignment
  - If not the same type, a cast operator must be used
  - Exception: pointer to **void** (type **void \***)
    - Generic pointer, represents any type
    - No casting needed to convert a pointer to **void** pointer
    - **void** pointers cannot be dereferenced

## 5.8 The Relationship Between Pointers and Arrays

- Arrays and pointers closely related
  - Array name like constant pointer
  - Pointers can do array subscripting operations
  - Having declared an array **b[ 5 ]** and a pointer **bPtr**
    - **bPtr** is equal to **b**

```
bPtr == b
```
    - **bPtr** is equal to the address of the first element of **b**

```
bPtr == &b[ 0 ]
```

## 5.8 The Relationship Between Pointers and Arrays

- Accessing array elements with pointers
  - Element **b[ n ]** can be accessed by **\*( bPtr + n )**
    - Called pointer/offset notation
  - Array itself can use pointer arithmetic.
    - **b[ 3 ]** same as **\*(b + 3)**
  - Pointers can be subscripted (pointer/subscript notation)
    - **bPtr[ 3 ]** same as **b[ 3 ]**

## 5.9 Arrays of Pointers

- Arrays can contain pointers
  - Commonly used to store an array of strings
 

```
char *suit[ 4 ] = {"Hearts", "Diamonds",
                  "Clubs", "Spades" };
```
  - Each element of suit is a pointer to a **char \*** (a string)
  - The strings are not in the array, only pointers to the strings are in the array

- **suit** array has a fixed size, but strings can be of any size

© 2000 Deitel & Associates, Inc. All rights reserved.

## 5.10 Case Study: A Card Shuffling and Dealing Simulation

- Card shuffling program
  - Use an array of pointers to strings, to store suit names
  - Use a double scripted array (suit by value)

- Place 1-52 into the array to specify the order in which the cards are dealt

© 2000 Deitel & Associates, Inc. All rights reserved.

## 5.10 Case Study: A Card Shuffling and Dealing Simulation

- Pseudocode for shuffling and dealing simulation

### First refinement

Initialize the suit array  
Initialize the face array  
Initialize the deck array

Shuffle the deck

Deal 52 cards

### Second refinement

For each of the 52 cards

Place card number in randomly  
selected unoccupied slot of deck

For each of the 52 cards

Find card number in deck array  
and print face and suit of card

### Third refinement

Choose slot of deck randomly

While chosen slot of deck has  
been previously chosen

Choose slot of deck randomly  
Place card number in chosen  
slot of deck

For each slot of the deck array

If slot contains card number  
Print the face and suit of the  
card

31 shuffle( deck );		
32 deal( deck, face, suit );		
33		

```

34     return 0;
35 }
36
37 void shuffle( int wDeck[][ 13 ] )
38 {
39     int row, column;
40
41     for ( int card = 1; card <= 52; card++ ) {
42         do {
43             row = rand() % 4;
44             column = rand() % 13;
45             } while ( wDeck[ row ][ column ] != 0 );
46
47         wDeck[ row ][ column ] = card;
48     }
49 }
50
51 void deal( const int wDeck[][ 13 ], const char *wFace[],
52           const char *wSuit[] )
53 {
54     for ( int card = 1; card <= 52; card++ )
55
56         for ( int row = 0; row <= 3; row++ )
57
58             for ( int column = 0; column <= 12; column++ )
59
60                 if ( wDeck[ row ][ column ] == card )
61                     cout << setw( 5 ) << setiosflags( ios::right )
62                        << wFace[ column ] << " of "
63                        << setw( 8 ) << setiosflags( ios::left )
64                        << wSuit[ row ]
65                        << ( card % 2 == 0 ? '\n' : '\t' );
66 }

```

The numbers 1-52 are randomly placed in the **deck** array.

So  
c  
th

## Outline

### 3. Define functions

The numbers 1-52 are randomly placed into the **deck** array.

Searches **deck** for the **card** number, then prints the **face** and **suit**.

Six of Clubs	Seven of Diamonds
Ace of Spades	Ace of Diamonds
Ace of Hearts	Queen of Diamonds
Queen of Clubs	Seven of Hearts
Ten of Hearts	Deuce of Clubs
Ten of Spades	Three of Spades
Ten of Diamonds	Four of Spades
Four of Diamonds	Ten of Clubs
Six of Diamonds	Six of Spades
Eight of Hearts	Three of Diamonds
Nine of Hearts	Three of Hearts
Deuce of Spades	Six of Hearts
Five of Clubs	Eight of Clubs
Deuce of Diamonds	Eight of Spades
Five of Spades	King of Clubs
King of Diamonds	Jack of Spades
Deuce of Hearts	Queen of Hearts
Ace of Clubs	King of Spades
Three of Clubs	King of Hearts
Nine of Clubs	Nine of Spades
Four of Hearts	Queen of Spades
Eight of Diamonds	Nine of Diamonds
Jack of Diamonds	Seven of Clubs
Five of Hearts	Five of Diamonds
Four of Clubs	Jack of Hearts
Jack of Clubs	Seven of Spades

## Outline

### Program Output

## 5.11 Function Pointers

- Pointers to functions
  - Contain the address of the function
  - Similar to how an array name is the address of its first element
  - Function name is starting address of code that defines function
- Function pointers can be
  - Passed to functions
  - Stored in arrays
  - Assigned to other function pointers

## 5.11 Function Pointers

- Example: bubblesort
  - Function **bubble** takes a function pointer
    - The function determines whether the array is sorted into ascending or descending sorting
  - The argument in **bubble** for the function pointer
 

```
bool ( *compare )( int, int )
```

 tells **bubble** to expect a pointer to a function that takes two **ints** and returns a **bool**
  - If the parentheses were left out
 

```
bool *compare( int, int )
```

 would declare a function that receives two integers and returns a pointer to a **bool**

69		<a href="#">Outline</a>
70 bool ascending( int a, int b )		3.1 Define functions
71 {		
72     return b < a;   // swap if b is less than a		
73 }		
74		
75 bool descending( int a, int b )		
76 {		
77     return b > a;   // swap if b is greater than a		
78 }

## 5.12.1 Fundamentals of Characters and Strings

- String assignment
  - Character array:
 

```
char color[] = "blue";
```

    - Creates 5 element **char** array, **color**, (last element is '**\0**')
  - variable of type **char \***

```
char *colorPtr = "blue";
```

    - Creates a pointer to string "blue", **colorPtr**, and stores it somewhere in memory

## 5.12.1 Fundamentals of Characters and Strings

- Reading strings
  - Assign input to character array **word[ 20 ]**

```
cin >> word
```

    - Reads characters until whitespace or EOF
    - String could exceed array size
 

```
cin >> setw( 20 ) >> word;
```

      - Reads 19 characters (space reserved for '**\0**')
  - **cin.getline**
    - Reads a line of text
    - Using **cin.getline**

```
cin.getline( array, size, delimiter character);
```

## 5.12.1 Fundamentals of Characters and Strings

- **cin.getline**

- Copies input into specified array until either
  - One less than the size is reached
  - The delimiter character is input
- Example

```
char sentence[ 80 ];
cin.getline( sentence, 80, '\n' );
```

## 5.12.2 String Manipulation Functions of the String-handling Library

- String handling library **<cstring>** provides functions to
  - Manipulate strings
  - Compare strings
  - Search strings
  - Tokenize strings (separate them into logical pieces)
- ASCII character code
  - Strings are compared using their character codes
  - Easy to make comparisons (greater than, less than, equal to)
- Tokenizing
  - Breaking strings into tokens, separated by user-specified characters
  - Tokens are usually logical units, such as words (separated by spaces)
  - **"This is my string"** has 4 word tokens (separated by spaces)

### 5.12.2 String Manipulation Functions of the String-handling Library

<code>char *strcpy( char *s1, const char *s2 );</code>	Copies the string <b>s2</b> into the character array <b>s1</b> . The value of <b>s1</b> is returned.
<code>char *strncpy( char *s1, const char *s2, size_t n );</code>	Copies at most <b>n</b> characters of the string <b>s2</b> into the character array <b>s1</b> . The value of <b>s1</b> is returned.
<code>char *strcat( char *s1, const char *s2 );</code>	Appends the string <b>s2</b> to the string <b>s1</b> . The first character of <b>s2</b> overwrites the terminating null character of <b>s1</b> . The value of <b>s1</b> is returned.
<code>char *strncat( char *s1, const char *s2, size_t n );</code>	Appends at most <b>n</b> characters of string <b>s2</b> to string <b>s1</b> . The first character of <b>s2</b> overwrites the terminating null character of <b>s1</b> . The value of <b>s1</b> is returned.
<code>int strcmp( const char *s1, const char *s2 );</code>	Compares the string <b>s1</b> with the string <b>s2</b> . The function returns a value of zero, less than zero or greater than zero if <b>s1</b> is equal to, less than or greater than <b>s2</b> , respectively.

### 5.12.2 String Manipulation Functions of the String-handling Library (III)

<code>int strncmp( const char *s1, const char *s2, size_t n );</code>	Compares up to <b>n</b> characters of the string <b>s1</b> with the string <b>s2</b> . The function returns zero, less than zero or greater than zero if <b>s1</b> is equal to, less than or greater than <b>s2</b> , respectively.
<code>char *strtok( char *s1, const char *s2 );</code>	A sequence of calls to <b>strtok</b> breaks string <b>s1</b> into “tokens”—logical pieces such as words in a line of text—delimited by characters contained in string <b>s2</b> . The first call contains <b>s1</b> as the first argument, and subsequent calls to continue tokenizing the same string contain <b>NULL</b> as the first argument. A pointer to the current token is returned by each call. If there are no more tokens when the function is called, <b>NULL</b> is returned.
<code>size_t strlen( const char *s );</code>	Determines the length of string <b>s</b> . The number of characters preceding the terminating null character is returned.
