What Next in CDCL Solvers?

◆□ > ◆□ > ◆臣 > ◆臣 > ○臣 ○ のへで

Preliminaries

- Variables: *w*, *x*, *y*, *z*, *a*, *b*, *c*, ...
- Literals: $w, \bar{x}, \bar{y}, a, \ldots$, but also $\neg w, \neg y, \ldots$
- Clauses: disjunction of literals or set of literals
- Formula: conjunction of clauses or set of clauses
- Model (satisfying assignment): partial/total mapping from variables to {0,1} that satisfies formula

• Formula can be SAT/UNSAT

Preliminaries

- Variables: *w*, *x*, *y*, *z*, *a*, *b*, *c*, ...
- Literals: $w, \bar{x}, \bar{y}, a, \ldots$, but also $\neg w, \neg y, \ldots$
- Clauses: disjunction of literals or set of literals
- Formula: conjunction of clauses or set of clauses
- Model (satisfying assignment): partial/total mapping from variables to {0,1} that satisfies formula
- Formula can be SAT/UNSAT
- Example:

 $\mathcal{F} \triangleq (r) \land (\bar{r} \lor s) \land (\bar{w} \lor a) \land (\bar{x} \lor b) \land (\bar{y} \lor \bar{z} \lor c) \land (\bar{b} \lor \bar{c} \lor d)$

- Example models:
 - $\{r, s, a, b, c, d\}$
 - $\blacktriangleright \{r, s, \bar{x}, y, \bar{w}, z, \bar{a}, b, c, d\}$

Resolution

• Resolution rule:

[DP60,R65]

 $\frac{(\alpha \lor x) \qquad (\beta \lor \bar{x})}{(\alpha \lor \beta)}$

- Complete proof system for propositional logic

Resolution

• Resolution rule:

[DP60,R65]

 $\frac{(\alpha \lor x)}{(\alpha \lor \beta)}$

- Complete proof system for propositional logic

- Extensively used with (CDCL) SAT solvers

Resolution

• Resolution rule:

[DP60,R65]

$$\frac{(\alpha \lor x) \qquad (\beta \lor \bar{x})}{(\alpha \lor \beta)}$$

- Complete proof system for propositional logic

- Extensively used with (CDCL) SAT solvers

• Self-subsuming resolution (with $\alpha' \subseteq \alpha$):

[e.g. SP04,EB05]

$$\begin{array}{c} (\alpha \lor x) & (\alpha' \lor \bar{x}) \\ \hline & (\alpha) \end{array}$$

- (α) subsumes ($\alpha \lor x$)

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへ(?)

 $\mathcal{F} = (r) \land (\bar{r} \lor s) \land \\ (\bar{w} \lor a) \land (\bar{x} \lor \bar{a} \lor b) \\ (\bar{y} \lor \bar{z} \lor c) \land (\bar{b} \lor \bar{c} \lor d)$

$$\mathcal{F} = (r) \land (\bar{r} \lor s) \land (\bar{w} \lor a) \land (\bar{x} \lor \bar{a} \lor b) (\bar{y} \lor \bar{z} \lor c) \land (\bar{b} \lor \bar{c} \lor d)$$

• Decisions / Variable Branchings: w = 1, x = 1, y = 1, z = 1

▲□▶ ▲圖▶ ▲≣▶ ▲≣▶ = 差 = のへで

$$\mathcal{F} = (r) \land (\bar{r} \lor s) \land (\bar{w} \lor a) \land (\bar{x} \lor \bar{a} \lor b) (\bar{y} \lor \bar{z} \lor c) \land (\bar{b} \lor \bar{c} \lor d)$$

• Decisions / Variable Branchings: w = 1, x = 1, y = 1, z = 1

$$\mathcal{F} = (r) \land (\bar{r} \lor s) \land (\bar{w} \lor a) \land (\bar{x} \lor \bar{a} \lor b) (\bar{y} \lor \bar{z} \lor c) \land (\bar{b} \lor \bar{c} \lor d)$$

Decisions / Variable Branchings:
w = 1, x = 1, y = 1, z = 1

- Antecedent (or reason) of an implied assignment
 - $(\bar{b} \lor \bar{c} \lor d)$ for d
- Associate assignment with decision levels
 - w = 1 @ 1, x = 1 @ 2, y = 1 @ 3, z = 1 @ 4
 - ▶ r = 1 @ 0, d = 1 @ 4, ...

Resolution Proofs

- Refutation of unsatisfiable formula by iterated resolution operations produces resolution proof
- An example:

 $\mathcal{F} = (\bar{c}) \land (\bar{b}) \land (\bar{a} \lor c) \land (a \lor b) \land (a \lor \bar{d}) \land (\bar{a} \lor \bar{d})$

Resolution proof:

 A modern SAT solver can generate resolution proofs using clauses learned by the solver [ZM03]

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

• CNF formula:

$$\mathcal{F} = (\bar{c}) \land (\bar{b}) \land (\bar{a} \lor c) \land (a \lor b) \land (a \lor \bar{d}) \land (\bar{a} \lor \bar{d})$$

Implication graph with conflict

• CNF formula:

$$\mathcal{F} = (\bar{c}) \land (\bar{b}) \land (\bar{a} \lor c) \land (a \lor b) \land (a \lor \bar{d}) \land (\bar{a} \lor \bar{d})$$

Proof trace \perp : $(\bar{a} \lor c) (a \lor b) (\bar{c}) (\bar{b})$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

• CNF formula:

$$\mathcal{F} = (\bar{c}) \land (\bar{b}) \land (\bar{a} \lor c) \land (a \lor b) \land (a \lor \bar{d}) \land (\bar{a} \lor \bar{d})$$

Resolution proof follows structure of conflicts

• CNF formula:

$$\mathcal{F} = (\bar{c}) \land (\bar{b}) \land (\bar{a} \lor c) \land (a \lor b) \land (a \lor \bar{d}) \land (\bar{a} \lor \bar{d})$$

Unsatisfiable subformula (core): $(\bar{c}), (\bar{b}), (\bar{a} \lor c), (a \lor b)$

What is a CDCL SAT Solver?

...

 Extend DPLL SAT solver with: 	[DP60,DLL62]
- Clause learning & non-chronological backtracking	[MSS96,BS97,Z97]
 Exploit UIPs 	[MSS96,SSS12]
 Minimize learned clauses 	[SB09,VG09]
 Opportunistically delete clauses 	[MSS96,MSS99,GN02]
– Search restarts	[GSK98,BMS00,H07,B08]
 Lazy data structures Watched literals 	[MMZZM01]
 Conflict-guided branching Lightweight branching heuristics Phase saving 	[MMZZM01] [PD07]

How Significant are CDCL SAT Solvers?

What Next in CDCL Solvers?

• Analyze conflict

▲ロト ▲圖 ▶ ▲ 臣 ▶ ▲ 臣 ▶ ● 臣 ● のへで

- Analyze conflict
 - Reasons: x and z
 - ▶ Decision variable & literals assigned at lower decision levels

- Analyze conflict
 - Reasons: x and z
 - ▶ Decision variable & literals assigned at lower decision levels

▲ロト ▲御 ト ▲ 臣 ト ▲ 臣 ト 一臣 - のへで

- Create **new** clause: $(\bar{x} \vee \bar{z})$

 $(\bar{a} \lor \bar{b})$ $(\bar{z} \lor b)$ $(\bar{x} \lor \bar{z} \lor a)$

- Analyze conflict
 - Reasons: x and z
 - ▶ Decision variable & literals assigned at lower decision levels
 - Create **new** clause: $(\bar{x} \vee \bar{z})$
- Can relate clause learning with resolution

- Analyze conflict
 - Reasons: x and z
 - ▶ Decision variable & literals assigned at lower decision levels
 - Create **new** clause: $(\bar{x} \vee \bar{z})$
- Can relate clause learning with resolution

- Analyze conflict
 - Reasons: x and z
 - ▶ Decision variable & literals assigned at lower decision levels
 - Create **new** clause: $(\bar{x} \vee \bar{z})$
- Can relate clause learning with resolution

- Analyze conflict
 - Reasons: x and z
 - ▶ Decision variable & literals assigned at lower decision levels
 - Create **new** clause: $(\bar{x} \vee \bar{z})$
- Can relate clause learning with resolution
 - Learned clauses result from (selected) resolution operations

(日)、

æ

• Clause $(\bar{x} \lor \bar{z})$ is asserting at decision level 1

・ロト ・ 雪 ト ・ ヨ ト

• Clause $(\bar{x} \lor \bar{z})$ is asserting at decision level 1

- Clause $(\bar{x} \lor \bar{z})$ is asserting at decision level 1
- Learned clauses are always asserting
- Backtracking differs from plain DPLL:
 - Always bactrack after a conflict

[MSS96,MSS99]

Unit propagation slow-down worse than linear as clauses are learned !

- Clause learning to be effective requires a more efficient representation: Watched Literals
 - Watched literals are one example of lazy data structures
 - But there are others

• Important states of a clause

[MMZZM01]

[MMZZM01]

- Important states of a clause
- Associate 2 references with each clause

[MMZZM01]

- Important states of a clause
- Associate 2 references with each clause
- Deciding unit requires traversing all literals

[MMZZM01]

- Important states of a clause
- Associate 2 references with each clause
- Deciding unit requires traversing all literals
- References **unchanged** when backtracking

Additional Key Techniques

• Lightweight branching

[e.g. MMZZM01]

- Use conflict to bias variables to branch on, associate score with each variable
- Prefer recent bias by regularly decreasing variable scores

Additional Key Techniques

• Lightweight branching

[e.g. MMZZM01]

- Use conflict to bias variables to branch on, associate score with each variable
- Prefer recent bias by regularly decreasing variable scores

Clause deletion policies

- Not practical to keep all learned clauses
- Delete larger clauses [e.g. MSS96]
- Delete less used clauses [e.g. GN02,ES03]

CDCL – A Glimpse of the Future

• Clause learning techniques

[e.g. ABHJS08,AS09]

- Clause learning is the key technique in CDCL SAT solvers
- Many recent papers propose improvements to the basic clause learning approach
- Preprocessing & inprocessing
 - Many recent papers
 - Essential in some applications

[e.g. JHB12,HJB11]

- Application-driven improvements
 - Incremental SAT
 - Handling of assumptions due to MUS extractors

[LB13]

 - Algorithm invokes SAT solver as (a variant of) an NP oracle
 - Black-box integration (using standard interface)
 - E.g. MaxSAT, MUSes, (2)QBF, etc.
- Note:
 - CNF encodings most often used with either black-box or white-box approaches
 - SAT techniques adapted in many other domains: QBF, SMT, QBF, CSP, ASP, ILP, ...

SAT-Based Problem Solving

 Some apps associated with more than one concept: planning, BMC, lazy clause generation, etc.

Examples of SAT-Based Problem Solving I

- Function problems in $FP^{NP}[\log n]$
 - Unweighted Maximum Satisfiability (MaxSAT)
 - Minimal Correction Subsets (MCSes)
 - Minimal models
 - ...
- Function problems in FP^{NP}
 - Weighted Maximum Satisfiability (MaxSAT)
 - Minimal Unsatisfiable Subformulas (MUSes)

- Minimal Equivalent Subformulas (MESes)
- Prime implicates
- ...
- Enumeration problems
 - Models
 - MUSes
 - MCSes
 - MaxSAT
 - ...

Examples of SAT-Based Problem Solving II

- Decision problems in Σ_2^P
 - 2QBF
 - ...
- Function problems in $FP^{\Sigma_2^P}$
 - Propositional formula minimization
 - (Weighted) Quantified MaxSAT (QMaxSAT)

- Smallest MUS (SMUS)
- ..
- Decision problems in PSPACE
 - QBF –

Encoding to CNF

- What to encode?
 - Boolean formulas
 - Tseitin's encoding
 - Plaisted&Greenbaum's encoding
 - **١**
 - Cardinality constraints
 - Pseudo-Boolean (PB) constraints
 - Can also translate to SAT:
 - Constraint Satisfaction Problems (CSPs)

- Answer Set Programming (ASP)
- Model Finding
- ► ...
- Key issues:
 - Encoding size
 - Arc-consistency?

Outline

CNF Encodings Boolean Formulas

Cardinality Constraints Pseudo-Boolean Constraints Encoding CSPs

SAT Embeddings

Conclusions

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへ⊙

Representing Boolean Formulas / Circuits I

- Satisfiability problems can be defined on Boolean circuits/formulas
- Can represent circuits/formulas as CNF formulas
- [T68,PG86]
- For each (simple) gate, CNF formula encodes the consistent assignments to the gate's inputs and output
 - Given z = OP(x, y), represent in CNF $z \leftrightarrow OP(x, y)$
- CNF formula for the circuit is the conjunction of CNF formula for each gate

$${\mathcal F}_c = (a \lor c) \land (b \lor c) \land (ar a \lor ar b \lor ar c)$$

 $\mathcal{F}_t = (\bar{r} \lor t) \land (\bar{s} \lor t) \land (r \lor s \lor \bar{t})$

Representing Boolean Formulas / Circuits II

 ${\mathcal F}_c = (a \lor c) \land (b \lor c) \land (ar a \lor ar b \lor ar c)$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ○臣 - の々ぐ

Representing Boolean Formulas / Circuits III

- CNF formula for the circuit is the conjunction of the CNF formula for each gate
 - Can specify objectives with additional clauses

$$\mathcal{F} = (a \lor x) \land (b \lor x) \land (\bar{a} \lor \bar{b} \lor \bar{x}) \land$$
$$(x \lor \bar{y}) \land (c \lor \bar{y}) \land (\bar{x} \lor \bar{c} \lor y) \land$$
$$(\bar{y} \lor z) \land (\bar{d} \lor z) \land (y \lor d \lor \bar{z}) \land (z)$$

▲ロト ▲理 ▶ ▲ ヨ ▶ ▲ 目 ▼ の < ⊙

Cardinality Constraints

• How to handle cardinality constraints, $\sum_{i=1}^{n} x_i \leq k$?

- How to handle AtMost1 constraints, $\sum_{i=1}^{n} x_i \leq 1$?
- General form: $\sum_{i=1}^{n} x_i \bowtie k$, with $\bowtie \in \{<, \leq, =, \geq, >\}$
- Solution #1:
 - Use native PB solver, e.g. BSOLO, PBS, Galena, Pueblo, etc.

- Difficult to keep up with advances in SAT technology
- For SAT/UNSAT, best solvers already encode to CNF
 - ▶ E.g. Minisat+, WBO, etc.

Cardinality Constraints

• How to handle cardinality constraints, $\sum_{i=1}^{n} x_i \leq k$?

- How to handle AtMost1 constraints, $\sum_{i=1}^{n} x_i \leq 1$?
- General form: $\sum_{i=1}^{n} x_i \bowtie k$, with $\bowtie \in \{<, \leq, =, \geq, >\}$
- Solution #1:

- Difficult to keep up with advances in SAT technology
- For SAT/UNSAT, best solvers already encode to CNF
 - ▶ E.g. Minisat+, WBO, etc.
- Solution #2:
 - Encode cardinality constraints to CNF
 - Use SAT solver

Equals1, AtLeast1 & AtMost1 Constraints

- $\sum_{j=1}^{n} x_j = 1$: encode with $\left(\sum_{j=1}^{n} x_j \leq 1\right) \land \left(\sum_{j=1}^{n} x_j \geq 1\right)$
- $\sum_{j=1}^{n} x_j \ge 1$: encode with $(x_1 \lor x_2 \lor \ldots \lor x_n)$
- $\sum_{j=1}^{n} x_j \leq 1$ encode with:
 - Pairwise encoding
 - Clauses: $\mathcal{O}(n^2)$; No auxiliary variables
 - Sequential counter
 - ▶ Clauses: $\mathcal{O}(n)$; Auxiliary variables: $\mathcal{O}(n)$
 - Bitwise encoding

[P07,FP01]

[S05]

▶ Clauses: $O(n \log n)$; Auxiliary variables: $O(\log n)$

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ○ □ ○ ○ ○

• Encode $\sum_{j=1}^{n} x_j \leq 1$ with bitwise encoding:

• An example: $x_1 + x_2 + x_3 \le 1$

▲□▶ ▲□▶ ▲ 臣▶ ★ 臣▶ 三臣 - のへぐ

• Encode $\sum_{j=1}^{n} x_j \leq 1$ with bitwise encoding:

- Auxiliary variables v_0, \ldots, v_{r-1} ; $r = \lceil \log n \rceil$ (with n > 1)
- If $x_j = 1$, then $v_0 \dots v_{r-1} = b_0 \dots b_{r-1}$, the binary encoding of j-1 $x_j \rightarrow (v_0 = b_0) \wedge \dots \wedge (v_{r-1} = b_{r-1}) \Leftrightarrow (\bar{x}_j \lor (v_0 = b_0) \wedge \dots \wedge (v_{r-1} = b_{r-1}))$

• An example: $x_1 + x_2 + x_3 \le 1$

	j-1	$v_1 v_0$
x_1	0	00
<i>x</i> ₂	1	01
<i>x</i> 3	2	10

• Encode $\sum_{j=1}^{n} x_j \leq 1$ with bitwise encoding:

- Auxiliary variables v_0, \ldots, v_{r-1} ; $r = \lceil \log n \rceil$ (with n > 1)
- If $x_j = 1$, then $v_0 \dots v_{r-1} = b_0 \dots b_{r-1}$, the binary encoding of j-1 $x_j \rightarrow (v_0 = b_0) \wedge \dots \wedge (v_{r-1} = b_{r-1}) \Leftrightarrow (\bar{x}_j \lor (v_0 = b_0) \wedge \dots \wedge (v_{r-1} = b_{r-1}))$
- Clauses $(\bar{x}_j \lor (v_i \leftrightarrow b_i)) = (\bar{x}_j \lor l_i), i = 0, \dots, r-1$, where
 - $l_i \equiv v_i$, if $b_i = 1$
 - ▶ $I_i \equiv \overline{v}_i$, otherwise

• An example: $x_1 + x_2 + x_3 \le 1$

	j-1	$v_1 v_0$	$(\overline{\mathbf{x}}_1 \lor \overline{\mathbf{y}}_1) \land (\overline{\mathbf{x}}_1 \lor \overline{\mathbf{y}}_0)$
<i>x</i> ₁	0	00	$(\overline{\mathbf{x}}_1 \lor \overline{\mathbf{v}}_1) \land (\overline{\mathbf{x}}_1 \lor \overline{\mathbf{v}}_0)$
<i>x</i> ₂	1	01	$(\overline{\mathbf{x}}_2 \lor \mathbf{v}_1) \land (\overline{\mathbf{x}}_2 \lor \mathbf{v}_0)$ $(\overline{\mathbf{x}}_2 \lor \mathbf{v}_1) \land (\overline{\mathbf{x}}_2 \lor \overline{\mathbf{v}}_0)$
<i>X</i> 3	2	10	$(\times_3 \vee v_1) \land (\times_3 \vee v_0)$
-			

- Encode $\sum_{j=1}^{n} x_j \leq 1$ with bitwise encoding:
 - Auxiliary variables v_0, \ldots, v_{r-1} ; $r = \lceil \log n \rceil$ (with n > 1)
 - If $x_j = 1$, then $v_0 \dots v_{r-1} = b_0 \dots b_{r-1}$, the binary encoding of j-1 $x_j \rightarrow (v_0 = b_0) \wedge \dots \wedge (v_{r-1} = b_{r-1}) \Leftrightarrow (\bar{x}_j \lor (v_0 = b_0) \wedge \dots \wedge (v_{r-1} = b_{r-1}))$
 - Clauses $(\bar{x}_j \lor (v_i \leftrightarrow b_i)) = (\bar{x}_j \lor l_i), i = 0, \dots, r-1$, where
 - $l_i \equiv v_i$, if $b_i = 1$
 - ▶ $l_i \equiv \overline{v}_i$, otherwise
 - If $x_j = 1$, assignment to v_i variables must encode j 1
 - All other x variables must take value 0
 - If all $x_j = 0$, any assignment to v_i variables is consistent
 - $\mathcal{O}(n \log n)$ clauses ; $\mathcal{O}(\log n)$ auxiliary variables
- An example: $x_1 + x_2 + x_3 \le 1$

	j-1	$v_1 v_0$
<i>x</i> ₁	0	00
x ₂	1	01
X3	2	10
0

Pseudo-Boolean Constraints

. . .

• General form: $\sum_{j=1}^{n} a_j x_j \le b$	
 Operational encoding 	[W98]
► Clauses/Variables: O(n)	
Does not guarantee arc-consistency	
– BDDs	[ES06]
 Worst-case exponential number of clauses 	
 Polynomial watchdog encoding 	[BBR09]
• Let $\nu(n) = \log(n) \log(a_{max})$	
• Clauses: $\mathcal{O}(n^3\nu(n))$; Aux variables: $\mathcal{O}(n^2\nu(n))$	
 Improved polynomial watchdog encoding 	[ANORC11b]
• Clauses & aux variables: $\mathcal{O}(n^3 \log(a_{max}))$	

Encoding PB Constraints with BDDs I

- Encode $3x_1 + 3x_2 + x_3 \le 3$
- Construct BDD
 - E.g. analyze variables by decreasing coefficients

• Extract ITE-based circuit from BDD

Encoding PB Constraints with BDDs I

- Encode $3x_1 + 3x_2 + x_3 \le 3$
- Construct BDD
 - E.g. analyze variables by decreasing coefficients
- Extract ITE-based circuit from BDD

Encoding PB Constraints with BDDs II

- Encode $3x_1 + 3x_2 + x_3 \le 3$
- Extract ITE-based circuit from BDD
- Simplify and create final circuit:

• How about $\sum_{j=1}^{n} a_j x_j = k$?

• How about $\sum_{j=1}^{n} a_j x_j = k$?

- Can use
$$(\sum_{j=1}^{n} a_j x_j \ge k) \land (\sum_{j=1}^{n} a_j x_j \le k)$$
, but...

▶ ∑_{j=1}ⁿ a_j x_j = k is a subset-sum constraint (special case of a knapsack constraint)

- How about $\sum_{j=1}^{n} a_j x_j = k$?
 - Can use $\left(\sum_{j=1}^{n} a_j x_j \ge k\right) \land \left(\sum_{j=1}^{n} a_j x_j \le k\right)$, but...
 - ► $\sum_{j=1}^{n} a_j x_j = k$ is a subset-sum constraint (special case of a knapsack constraint)
 - Cannot find all consequences in polynomial time

[S03,FS02,T03]

• How about $\sum_{j=1}^{n} a_j x_j = k$?

- Can use
$$\left(\sum_{j=1}^{n} a_j x_j \ge k\right) \land \left(\sum_{j=1}^{n} a_j x_j \le k\right)$$
, but...

• $\sum_{j=1}^{n} a_j x_j = k$ is a subset-sum constraint

(special case of a knapsack constraint)

Cannot find all consequences in polynomial time

[S03,FS02,T03]

 $4x_1 + 4x_2 + 3x_3 + 2x_4 = 5$

• How about $\sum_{j=1}^{n} a_j x_j = k$?

- Can use
$$\left(\sum_{j=1}^{n} a_j x_j \ge k\right) \land \left(\sum_{j=1}^{n} a_j x_j \le k\right)$$
, but...

• $\sum_{j=1}^{n} a_j x_j = k$ is a subset-sum constraint

(special case of a knapsack constraint)

Cannot find all consequences in polynomial time

[S03,FS02,T03]

Example:

 $4x_1 + 4x_2 + 3x_3 + 2x_4 = 5$

- Replace by $(4x_1 + 4x_2 + 3x_3 + 2x_4 \ge 5) \land (4x_1 + 4x_2 + 3x_3 + 2x_4 \le 5)$

• How about $\sum_{j=1}^{n} a_j x_j = k$?

- Can use
$$\left(\sum_{j=1}^{n} a_j x_j \ge k\right) \land \left(\sum_{j=1}^{n} a_j x_j \le k\right)$$
, but...

• $\sum_{j=1}^{n} a_j x_j = k$ is a subset-sum constraint

CSP Constraints

• Many possible encodings:

 Direct encoding 	[dK89,GJ96,W00]
 Log encoding 	[W00]
 Support encoding 	[K90,G02]
 Log-Support encoding 	[G07]
- Order encoding for finite linear CSPs	[TTKB09]

- ...

Direct Encoding for CSP w/ Binary Constraints

- Variable x_i with domain D_i , with $m_i = |D_i|$
- Represent values of x_i with Boolean variables x_{i,1},..., x_{i,mi}
- Require $\sum_{k=1}^{m_i} x_{i,k} = 1$ - Suffices to require $\sum_{k=1}^{m_i} x_{i,k} \ge 1$ [woo]

 If the pair of assignments x_i = v_i ∧ x_j = v_j is not allowed, add binary clause (x

 _{i,vi} ∨ x

 _{j,vj})

CNF Encodings

SAT Embeddings

Conclusions

Embedding SAT Solvers

- Modify SAT solver to interface problem-specific propagators (or theory solvers)
- Typical interface:
 - SAT solvers communicates assignments/constraints to propagators
 - Retrieve resulting assignments or explanations for inconsistency
- Well-known examples (many more):
 - Branch&bound PB optimization
 - Non-clausal SAT solvers
 - Lazy SMT solving
- Key problem:
 - Keeping up with improvements in SAT solvers

Pseudo-Boolean Constraints & Optimization

- Pseudo-Boolean Constraints:
 - Boolean variables: x_1, \ldots, x_n
 - Linear inequalities:

 $\sum_{j \in N} a_{ij} l_j \ge b_i, \quad l_j \in \{x_j, \bar{x}_j\}, x_j \in \{0, 1\}, a_{ij}, b_i \in \mathbb{N}_0^+$

Pseudo-Boolean Constraints & Optimization

- Pseudo-Boolean Constraints:
 - Boolean variables: x_1, \ldots, x_n
 - Linear inequalities:

 $\sum_{j \in N} a_{ij} l_j \ge b_i, \quad l_j \in \{x_j, \bar{x}_j\}, x_j \in \{0, 1\}, a_{ij}, b_i \in \mathbb{N}_0^+$

• Pseudo-Boolean Optimization (PBO):

 $\begin{array}{ll} \mbox{minimize} & \sum\limits_{j \in N} c_j \cdot x_j \\ \mbox{subject to} & \sum\limits_{j \in N} a_{ij} l_j \geq b_i, \\ & l_j \in \{x_j, \bar{x}_j\}, x_j \in \{0, 1\}, a_{ij}, b_i, c_j \in \mathbb{N}_0^+ \end{array}$

Pseudo-Boolean Constraints & Optimization

- Pseudo-Boolean Constraints:
 - Boolean variables: x_1, \ldots, x_n
 - Linear inequalities:

 $\sum_{j \in N} a_{ij} l_j \ge b_i, \quad l_j \in \{x_j, \bar{x}_j\}, x_j \in \{0, 1\}, a_{ij}, b_i \in \mathbb{N}_0^+$

• Pseudo-Boolean Optimization (PBO):

$$\begin{array}{ll} \text{minimize} & \sum\limits_{j \in \mathcal{N}} c_j \cdot x_j \\ \text{subject to} & \sum\limits_{j \in \mathcal{N}} a_{ij} l_j \geq b_i, \\ & l_j \in \{x_j, \bar{x}_j\}, x_j \in \{0, 1\}, a_{ij}, b_i, c_j \in \mathbb{N}_0^+ \end{array}$$

Branch and bound (B&B) PBO algorithm:

[MMS00]

- Extend SAT solver
- Must develop propagator for PB constraints
- B&B search for computing optimum cost function value
 - First Trivial upper bound: all $x_j = 1$
Limitations with Embeddings

B&B MaxSAT solving:

- Cannot use unit propagation
- Cannot learn clauses

• MUS extraction:

 Decision of clauses to include in MUS based on unsatisfiable outcomes

- No immediate gain from embedding SAT solvers
