

A STRONG COMPARISON PRINCIPLE FOR THE p -LAPLACIAN

PAOLO ROSELLI AND BERARDINO SCIUNZI

(Communicated by David S. Tartakoff)

ABSTRACT. We consider weak solutions of the differential inequality of p -Laplacian type

$$-\Delta_p u - f(u) \leq -\Delta_p v - f(v)$$

such that $u \leq v$ on a smooth bounded domain in \mathbb{R}^N and either u or v is a weak solution of the corresponding Dirichlet problem with zero boundary condition. Assuming that $u < v$ on the boundary of the domain we prove that $u < v$ and assuming that $u \equiv v \equiv 0$ on the boundary of the domain we prove $u < v$ unless $u \equiv v$. The novelty is that the nonlinearity f is allowed to change sign. In particular, the result holds for the model nonlinearity $f(s) = s^q - \lambda s^{p-1}$ with $q > p - 1$.

1. INTRODUCTION AND STATEMENT OF THE RESULTS

Throughout this article Ω will be a bounded smooth domain of \mathbb{R}^N with $N \geq 2$. A function $w \in C^{1,\alpha}(\overline{\Omega})$ (see [6, 8, 12]) solves the equation

$$-\Delta_p w = f(w) \text{ weakly on } \Omega$$

(where $p > 1$ and f is a continuous real function that is locally Lipschitz on its domain) if and only if

$$(1.1) \quad \int_{\Omega} |\nabla w|^{p-2} \nabla w \cdot \nabla \phi \, dx = \int_{\Omega} f(w) \phi \, dx \quad \forall \phi \in W_0^{1,p}(\Omega).$$

In this paper we consider the following problem:

$$(1.2) \quad \begin{cases} -\Delta_p w = f(w) & \text{weakly on } \Omega, \\ w > 0 & \text{on } \Omega, \\ w = 0 & \text{on } \partial\Omega. \end{cases}$$

We restrict our attention to the case of positive solutions, and we recall that by the strong maximum principle for the p -Laplacian under quite general hypotheses on f (see [10, 13]) any nonnegative solution is in fact strictly positive.

Two functions $u, v \in C^{1,\alpha}(\overline{\Omega})$ satisfy the inequality

$$-\Delta_p u - f(u) \leq -\Delta_p v - f(v) \text{ weakly on } \Omega$$

if and only if

$$\int_{\Omega} |\nabla u|^{p-2} \nabla u \cdot \nabla \psi \, dx - \int_{\Omega} f(u) \psi \, dx \leq \int_{\Omega} |\nabla v|^{p-2} \nabla v \cdot \nabla \psi \, dx - \int_{\Omega} f(v) \psi \, dx$$

for every $\psi \in W_0^{1,p}(\Omega)$ such that $\psi \geq 0$ a.e. Throughout this paper we will assume

$$(A)_p \left\{ \begin{array}{l} \text{both } u \text{ and } v \text{ are nonnegative on } \Omega, \\ \text{either } u \text{ or } v \text{ solves problem (1.2),} \\ -\Delta_p u - f(u) \leq -\Delta_p v - f(v) \quad \text{weakly on } \Omega. \end{array} \right.$$

We say that a Strong Comparison Principle (SCP for short) holds for two functions $u, v \in C^{1,\alpha}(\overline{\Omega})$ satisfying $(A)_p$ if from the inequalities

$$u \leq v \quad \text{on } \Omega$$

we can infer the alternative

$$u < v \text{ on } \Omega \quad \text{unless} \quad u \equiv v \text{ on } \Omega.$$

We want to prove that, under suitable boundary conditions, such an SCP holds.

The novelty of the paper is that f can be a sign changing nonlinearity. For example, our assumptions allow us to consider nonlinearities such as

$$f(s) = s^q - \lambda s^{p-1} \quad (\text{with } q > p - 1).$$

Even when f has definite sign, it is well known that this is a hard task due to the nonlinear degenerate nature of the p-Laplace operator. In fact, comparison principles are not equivalent in this case to maximum principles as for the case of linear operators. We refer the readers to [10] and the references therein for an interesting overview on this topic, and we recall here some known results.

In [3] it is proved that, if f is locally Lipschitz, a Strong Comparison Principle holds in any connected component of $\Omega \setminus Z_{u,v}$ where $Z_{u,v} \equiv \{x \in \Omega \mid \nabla u(x) = 0 = \nabla v(x)\}$. In [7] it is proved that, if f is positive and nondecreasing, a Strong Comparison Principle holds assuming that u, v are both solutions of problem (1.2) or assuming as the boundary condition in (1.2) that $u < v$ on $\partial\Omega$. The results in [7] have been recently extended to a more general class of operators in [9], where also some interesting estimates on the set of possible touching points are proved. The assumptions of Theorem 1.3 in [9] are equivalent, in our context, to assuming that f is positive and nondecreasing. Also, we point out some interesting results in [1, 2] where the case of solutions of (1.2) is considered and a Strong Comparison Principle is proved for a particular class of problems involving nonlinearities that do not change sign.¹

Some details of our proofs are similar to the ones in [1, 2]. In particular, we point out that we will use a Divergence Theorem stated and proved in [2], together with some regularity results from [4]. The crucial tool anyway is a general result recently obtained in [5] where the case of positive nonlinearities is considered. Here we adapt Theorem 1.4 in [5] for future use.

¹The nonlinearities considered in [1, 2] could change sign if the solutions u, v change sign. Anyway this does not occur since the authors show that the solutions are nonnegative.

Lemma 1.1. *Assume $\frac{2N+2}{N+2} < p \leq 2$ or $p \geq 2$. Let $u, v \in C^{1,\alpha}(\overline{\Omega})$ satisfy $(A)_p$ and f satisfy the following hypothesis:*

- (f_1) f is continuous on $[0, +\infty)$,
- (f_2) f is locally Lipschitz continuous on $(0, +\infty)$.

Assume that u is a solution of (1.2) in Ω and assume that $f(u)$ has a definite sign on a domain $\Omega' \subseteq \Omega$ (let us say $f(u) > 0$); if $u \leq v$ and $u \neq v$ in Ω' , then $u < v$ in Ω' .

The same result follows assuming that v is a solution of (1.2) in Ω and $f(v)$ has a definite sign on Ω' .

Remark 1.2. The restriction $p > \frac{2N+2}{N+2}$ allows $|\nabla u|^{p-2}$ to be in $L^1(\Omega)$ (in [4] see Theorem 2.3). Lemma 1.1 follows from Theorem 1.4 in [5] by simple considerations. In Theorem 1.4 of [5] only the assumption $f(u) > 0$ is considered, however it is clear from its proof that the assumption $f(u) < 0$ is equivalent to the assumption $f(u) > 0$. The statement of Lemma 1.1 is a local version of Theorem 1.4 in [5] since it holds in any domain $\Omega' \subseteq \Omega$. Looking at the proof of Theorem 1.4 in [5] this causes only that a local version of Theorem 2.1 in [5] (see also Theorem 1.1 in [4]) is needed. The latter can be found in [11].

The aim of this paper is to deal with sign changing nonlinearities. More precisely, we keep hypothesis $(A)_p, (f_1), (f_2)$ without assuming that $f(u)$ or $f(v)$ has definite sign. We simply assume

$$(f_3) \quad f(t) \begin{cases} = 0 & \text{if } t = 0 \text{ or } t = k > 0, \\ < 0 & \text{if } t \in (0, k), \\ > 0 & \text{if } t \in (k, +\infty), \end{cases}$$

$$(f_4) \quad f \text{ is nondecreasing on some open interval } I_k \text{ containing } k.$$

We prove the following

Theorem 1.3. *Assume $\frac{2N+2}{N+2} < p \leq 2$ or $p \geq 2$. Let $u, v \in C^{1,\alpha}$ satisfy $(A)_p$ with f fulfilling $(f_1), (f_2), (f_3), (f_4)$, and assume that $u \leq v$ in Ω . Then, if $u < v$ on $\partial\Omega$, it follows*

$$u < v \text{ in } \Omega.$$

Theorem 1.4. *Assume $\frac{2N+2}{N+2} < p \leq 2$ or $p \geq 2$. Let $u, v \in C^{1,\alpha}$ both satisfy (1.2) with f fulfilling $(f_1), (f_2), (f_3), (f_4)$, and assume that $u \leq v$ in Ω . Then, if $u \equiv v \equiv 0$ on $\partial\Omega$, the following alternative holds:*

$$u < v \text{ in } \Omega \quad \text{or} \quad u \equiv v \text{ in } \Omega.$$

2. PROOF OF THEOREM 1.3

Let us consider the set where u and v possibly coincide:

$$C_{u,v} = \{x \in \Omega : u(x) = v(x)\}.$$

We want to show that $C_{u,v} = \emptyset$. By contradiction, we assume that the closed set $C_{u,v}$ is not empty. This, under our hypothesis, equals $\partial C_{u,v} \neq \emptyset$.

2.1. Step 1. We claim that at each $x \in \partial C_{u,v}$ we have $u(x) = k$. We already know that $u \equiv v > 0$ on $C_{u,v} \supset \partial C_{u,v}$ since either u or v is a solution of problem (1.2). Assume by contradiction that there exists some $\bar{x} \in \partial C_{u,v}$ such that $u(\bar{x}) \neq k$. By hypothesis (f_3) , we have $f(u(\bar{x})) \neq 0$. Without loss of generality we can consider $f(u(\bar{x})) > 0$, and u as a solution of problem (1.2); in this case we can find an open ball $B(\bar{x}, r_{\bar{x}})$ centered at \bar{x} such that $f(u) > 0$ on $B(\bar{x}, r_{\bar{x}})$. Since $\bar{x} \in \partial C_{u,v}$, u can not coincide with v on the whole $B(\bar{x}, r_{\bar{x}})$, thus we can apply Lemma 1.1 getting $u < v$ on $B(\bar{x}, r_{\bar{x}})$, and this contradicts the hypothesis $u(\bar{x}) = v(\bar{x})$.

2.2. Step 2. By assuming $C_{u,v} \neq \emptyset$, the function $dist(x, C_{u,v})$ is well defined at each $x \in \Omega$ and we can consider the open set

$$C_{u,v}^\epsilon = \{x \in \Omega : dist(x, C_{u,v}) < \epsilon\} \quad (\text{where } \epsilon > 0).$$

Since $u \equiv v \equiv k$ on $\partial C_{u,v}$, we can claim that there exists a $\bar{\epsilon} > 0$ such that

$$(2.1) \quad \forall x \in C_{u,v}^{\bar{\epsilon}} \setminus C_{u,v} \quad u(x) \in I_k \quad \text{and} \quad v(x) \in I_k.$$

On the contrary we would have that

$$\forall \epsilon > 0 \exists x_\epsilon \in C_{u,v}^\epsilon \setminus C_{u,v} \quad u(x_\epsilon) \notin I_k \quad \text{or} \quad v(x_\epsilon) \notin I_k.$$

By choosing $\epsilon = \frac{1}{n}$ there would exist a sequence (x_n) such that

$$x_n \in C_{u,v}^{\frac{1}{n}} \setminus C_{u,v} \quad u(x_n) \notin I_k \quad \text{or} \quad v(x_n) \notin I_k.$$

From this sequence we could extract a subsequence $(x_{n'})$ such that

$$x_{n'} \in C_{u,v}^{\frac{1}{n'}} \setminus C_{u,v} \quad w(x_{n'}) \notin I_k$$

where w would be either u or v . As Ω is bounded we could extract from $(x_{n'})$ a subsequence $(x_{n''})$ that would necessarily converge to some point $z \in \partial C_{u,v}$ where $w(z) = k$. But this would end the contradiction $w(x_{n''}) \rightarrow k$ and $w(x_{n''}) \notin I_k$.

2.3. Step 3 [Contradiction]. By construction we have that $u < v$ on $\partial C_{u,v}^{\bar{\epsilon}}$. As $\partial C_{u,v}^{\bar{\epsilon}}$ is compact, there exists some $\rho > 0$ such that $u + \rho < v$ on $\partial C_{u,v}^{\bar{\epsilon}}$. Let us consider the function $w_\rho : \bar{\Omega} \rightarrow [0, +\infty)$ defined as follows:

$$w_\rho = \begin{cases} (u + \rho - v)^+ & \text{on } C_{u,v}^{\bar{\epsilon}}, \\ 0 & \text{on } \bar{\Omega} \setminus C_{u,v}^{\bar{\epsilon}}. \end{cases}$$

Since $u + \rho < v$ on $\partial C_{u,v}^{\bar{\epsilon}}$, we have that $w_\rho \in W_0^{1,p}(\Omega)$ and

$$\nabla w_\rho = \begin{cases} \nabla u - \nabla v & \text{where } w_\rho > 0, \\ 0 & \text{elsewhere.} \end{cases}$$

As w_ρ is a test function, we can use it in (1.1) obtaining²

$$\begin{aligned} \int_{\Omega} |\nabla u|^{p-2} \nabla u \cdot \nabla w_\rho &= \int_{\Omega} f(u)w_\rho \\ &\quad \left\langle \text{since } w_\rho = 0 \text{ on } \Omega \setminus C_{u,v}^\varepsilon \right\rangle \\ &= \int_{C_{u,v}^\varepsilon} f(u)w_\rho \\ &= \int_{C_{u,v}^\varepsilon \setminus C_{u,v}} f(u)w_\rho + \int_{C_{u,v}} f(u)w_\rho \\ &= \int_{C_{u,v}^\varepsilon \setminus C_{u,v}} f(u)w_\rho + \int_{C_{u,v}} f(v)w_\rho \\ &\quad \left\langle \text{by (2.1) and } (f_4) \right\rangle \\ &\leq \int_{C_{u,v}^\varepsilon \setminus C_{u,v}} f(v)w_\rho + \int_{C_{u,v}} f(v)w_\rho \\ &= \int_{C_{u,v}^\varepsilon} f(v)w_\rho = \int_{\Omega} f(v)w_\rho \\ &\quad \left\langle \text{recall } (A)_p \text{ and } u \text{ is a solution of (1.2)} \right\rangle \\ &\leq \int_{\Omega} |\nabla v|^{p-2} \nabla v \cdot \nabla w_\rho \end{aligned}$$

that is,

$$\begin{aligned} \int_{\Omega} \left(|\nabla u|^{p-2} \nabla u - |\nabla v|^{p-2} \nabla v \right) \cdot \nabla w_\rho \\ = \int_{\{w_\rho > 0\}} \left(|\nabla u|^{p-2} \nabla u - |\nabla v|^{p-2} \nabla v \right) \cdot (\nabla u - \nabla v) \leq 0 . \end{aligned}$$

By recalling (see for example [3]) that there exists some positive constant C_p such that for each $\eta, \eta' \in \mathbb{R}^N$

$$(|\eta|^{p-2}\eta - |\eta'|^{p-2}\eta') \cdot (\eta - \eta') \geq C_p (|\eta| + |\eta'|)^{p-2} |\eta - \eta'|^2 ,$$

we get

$$C_p \int_{\{w_\rho > 0\}} \left(|\nabla u| + |\nabla v| \right)^{p-2} |\nabla u - \nabla v|^2 \leq 0 .$$

This implies that $u - v$ equals some constant on $\{w_\rho > 0\}$, that is, w_ρ is a constant on $\{w_\rho > 0\}$. By continuity of w_ρ this constant must be zero since $w_\rho = 0$ on $\partial C_{u,v}^\varepsilon$. Thus, we have that $w_\rho \equiv 0$ in $C_{u,v}^\varepsilon$, that is,

$$u + \rho \leq v \quad \text{on } C_{u,v}^\varepsilon \quad (\text{i.e. } u < v \quad \text{on } C_{u,v}^\varepsilon),$$

and this contradicts the fact that $C_{u,v}^\varepsilon \supset C_{u,v} \neq \emptyset$.

²We put comments between $\langle \rangle$ brackets.

3. PROOF OF THEOREM 1.4

Since $u = 0$ on $\partial\Omega$ and $u \in C^{1,\alpha}(\overline{\Omega})$, there exists an open neighborhood U of $\partial\Omega$ such that $0 < u < k$ on $V = U \cap \Omega$. Since $f(u) < 0$ on V , there the SCP holds by Lemma 1.1; therefore $u \equiv v$ on V or $u < v$ on V . In the latter case we can find a set $\Gamma^\epsilon = \{x \in \Omega : \text{dist}(x, \partial\Omega) \geq \epsilon\}$ for a suitable $\epsilon > 0$ such that $u < v$ on $\partial\Gamma^\epsilon$; exploiting Theorem 1.3, we get $u < v$ on Γ^ϵ , and therefore $u < v$ on Ω . Thus, in the sequel we will consider the former case ($u \equiv v$ on V) and prove that u must coincide with v on Ω . As in Theorem 1.3, we define $C_{u,v} = \{x \in \Omega : u(x) = v(x)\}$ and $C_{u,v}^\epsilon = \{x \in \Omega : \text{dist}(x, C_{u,v}) < \epsilon\}$. Let us assume by contradiction that there exists some $x_0 \in \Omega$ such that $u(x_0) < v(x_0)$. Arguing as in Section 2.2 of the proof of Theorem 1.3, we can always find an ϵ such that $0 < \epsilon < \text{dist}(x_0, \partial C_{u,v})$ and

$$\forall x \in C_{u,v}^\epsilon \setminus C_{u,v} \quad u(x) \in I_k \quad \text{and} \quad v(x) \in I_k .$$

Let us observe that $(\Omega \setminus C_{u,v}) \cap C_{u,v}^\epsilon$ is a nonempty open set and $\partial C_{u,v}^\epsilon \setminus \partial\Omega \neq \emptyset$ by the assumption $0 < \epsilon < \text{dist}(x_0, \partial C_{u,v})$. Moreover at each $x \in \partial C_{u,v}^\epsilon \setminus \partial\Omega$ we have $u(x) < v(x)$. By compactness of $\partial C_{u,v}^\epsilon \setminus \partial\Omega$ and continuity of u and v , there exists $\rho > 0$ such that $u + \rho < v$ on $\partial C_{u,v}^\epsilon \setminus \partial\Omega$. Let us define

$$w_\rho = \begin{cases} (u + \rho - v)^+ & \text{on } C_{u,v}^\epsilon, \\ 0 & \text{on } \Omega \setminus C_{u,v}^\epsilon . \end{cases}$$

We have that $w_\rho \in W^{1,p}(\Omega)$ and

$$\nabla w_\rho = \begin{cases} \nabla u - \nabla v & \text{where } w_\rho > 0, \\ 0 & \text{elsewhere.} \end{cases}$$

Let us observe that $\nabla w_\rho = \nabla u - \nabla v = 0$ on \overline{V} . This allows us to use w_ρ “as a test function” even if $w_\rho \notin W_0^{1,p}(\Omega)$; in fact, we will see that the boundary terms appearing in the Divergence Theorem for u and v coincide.

As pointed out in [5], a C^1 solution of (1.2), with f as in our hypothesis, belongs to the class $C^2(\Omega \setminus Z)$, where $Z = \{x \in \Omega : \nabla u(x) = 0\}$; therefore the generalized derivatives of $|\nabla u|^{p-2} u_{x_i}$ coincide with the classical ones on $\Omega \setminus Z$. Moreover in [5] it was proved that $|\nabla u|^{p-2} u_{x_i} \in W^{1,2}(\Omega)$. Since $w_\rho \in W^{1,2}(\Omega)$ we have that $\text{div}(w_\rho |\nabla u|^{p-2} \nabla u) \in L^1$. The vector field $w_\rho |\nabla u|^{p-2} \nabla u$ belongs to $[C^0(\Omega)]^N$, so we can apply the Divergence Theorem as stated in [2] pag.742, obtaining

$$\int_{\Omega} \text{div}(w_\rho |\nabla u|^{p-2} \nabla u) \, dx = \int_{\partial\Omega} w_\rho |\nabla u|^{p-2} \frac{\partial u}{\partial \nu} \, d\sigma .$$

Since $\operatorname{div}(w_\rho |\nabla u|^{p-2} \nabla u) = w_\rho \operatorname{div}(|\nabla u|^{p-2} \nabla u) + |\nabla u|^{p-2} \nabla u \cdot \nabla w_\rho$ and also $-\operatorname{div}(|\nabla u|^{p-2} \nabla u) = f(u)$ almost everywhere, we obtain (exploiting as in Theorem 1.3)

$$\begin{aligned}
 \int_{\Omega} |\nabla u|^{p-2} \nabla u \cdot \nabla w_\rho \, dx &= \int_{\Omega} f(u) w_\rho \, dx + \int_{\partial\Omega} w_\rho |\nabla u|^{p-2} \frac{\partial u}{\partial \nu} \, d\sigma \\
 &= \int_{\Omega} f(u) w_\rho \, dx + \int_{\partial\Omega} w_\rho |\nabla v|^{p-2} \frac{\partial v}{\partial \nu} \, d\sigma \\
 &= \int_{C_{u,v}^\epsilon} f(u) w_\rho \, dx + \int_{\partial\Omega} w_\rho |\nabla v|^{p-2} \frac{\partial v}{\partial \nu} \, d\sigma \\
 &= \int_{C_{u,v}^\epsilon \cap C_{u,v}} f(u) w_\rho \, dx + \int_{C_{u,v}^\epsilon \setminus C_{u,v}} f(u) w_\rho \, dx + \int_{\partial\Omega} w_\rho |\nabla v|^{p-2} \frac{\partial v}{\partial \nu} \, d\sigma \\
 &= \int_{C_{u,v}^\epsilon \cap C_{u,v}} f(v) w_\rho \, dx + \int_{C_{u,v}^\epsilon \setminus C_{u,v}} f(u) w_\rho \, dx + \int_{\partial\Omega} w_\rho |\nabla v|^{p-2} \frac{\partial v}{\partial \nu} \, d\sigma \\
 &\leq \int_{C_{u,v}^\epsilon \cap C_{u,v}} f(v) w_\rho \, dx + \int_{C_{u,v}^\epsilon \setminus C_{u,v}} f(v) w_\rho \, dx + \int_{\partial\Omega} w_\rho |\nabla v|^{p-2} \frac{\partial v}{\partial \nu} \, d\sigma \\
 &= \int_{\Omega} f(v) w_\rho \, dx + \int_{\partial\Omega} w_\rho |\nabla v|^{p-2} \frac{\partial v}{\partial \nu} \, d\sigma \\
 &=_{(*)} \int_{\Omega} |\nabla v|^{p-2} \nabla v \cdot \nabla w_\rho \, dx .
 \end{aligned}$$

Arguing as in Theorem 1.3 we conclude the contradiction $w_\rho = 0$ (that is, $u + \rho \leq v$) in $C_{u,v}^\epsilon \supset C_{u,v} \neq \emptyset$.

Remark 3.1. Further extensions are possible. For example, one may guess that in Theorem 1.4 the thesis is still valid by assuming that $u, v \in C^{1,\alpha}$ simply satisfy $(A)_p$, instead of both being solutions of (1.2). This is actually true if the function that is not a solution of (1.2) (let us say v) shares the same regularity as the solution u . In such a case the Divergence Theorem can still be applied to v giving, with $(A)_p$, the inequality \leq instead of the equality at the final step $(*)$. However, we skipped such a statement because here shortness and simplicity is our aim.
